PROFESSIONAL SUMMARY

Technical product builder shaping AI products where user needs, technology, and strategy meet. Brings product sense, analytical thinking, and engineering depth to ambiguous problems - using user feedback and evidence to prioritize what matters, navigate trade-offs, and turn complex capabilities into intuitive experiences through cross-functional execution.

CORE COMPETENCIES

- **Product Strategy & Execution:** Product Discovery, User Research, PRDs & Requirements, Roadmapping, MVP Scoping, Prioritization, Product Lifecycle, Stakeholder Management
- **User Experience & Validation:** User Journeys, UX Flow Review, Usability Testing, Prototyping, Feedback Synthesis, Validation
- **Analytics & Decision-Making:** KPI & North Star Metrics, Root-Cause Analysis, Data Analysis, Cost/Capability Trade-offs
- **AI & Technical:** Agentic AI, LLM, RAG, Human-in-the-Loop, SQL, Python, C++, FastAPI, PostgreSQL, BigQuery, GCP, Docker

PROFESSIONAL EXPERIENCE

Software Engineer - KPIT Technologies | Pune, India
May 2024 - Present

Full Time: Feb 2025 – Present | Internship: May 2024 - Feb 2025

- **Shape two company-wide AI products used across geographies** - an agent-building web platform (~1,800 users across ~85 client teams) and an AI developer CLI (~1,200 users) - working directly with users and cross-functionally with AI engineering, QA, DevOps, and UX/Design to translate feedback into requirements, prioritize improvements, and support releases.
- **Proposed, researched, built, and rolled out the CLI model auto-router**, securing leadership buy-in and coordinating with DevOps; routing by task complexity, model capability, and caching reduced token cost by 36% while maintaining output quality and enabled selective reintroduction of frontier models that had previously been disabled for cost.
- **Built an AI evaluation framework** using golden datasets, deterministic quality gates, LLM-as-judge rubrics, and continuous user feedback to compare model and feature changes before rollout and strengthen release confidence.
- **Created model-selection documentation and delivered 3 client-team demos**, translating model capability, behavior, cost, and product features into practical workflow guidance; brought stakeholder questions and feedback back into product iteration.
- **Shipped product capabilities across both platforms**, including agent skills, human-in-the-loop controls for high-risk actions, pre-built/custom CLI skills, and memory; used direct user feedback, usage patterns, hands-on product use, and AI-tooling trends to shape improvements.
- **Contributed across the product-development lifecycle** - backlog refinement, requirements, feature prioritization, technical scoping, UX/workflow review, defect resolution, and QA validation - helping move ideas from user need to shipped product.
- **Built separate internal debugging and validation agents** that reduced manual debugging effort by 50% and QA preparation time by 65%, while improving test coverage and accelerating repetitive engineering workflows.
- **Mentored three interns** across requirements, implementation, and code reviews; progressed into a separate trial prototype.

Recognition: KPIT Spot Award (2026) and Team Award (2025) for individual impact and team contribution.

SELECTED PRODUCT EXPERIENCE

BloodNet | AI-Powered Blood Supply Orchestration Platform

Creator | Product & Engineering | Google Patchamomma 2026: Rank #36 | Top-100 NASSCOM Agentic AI Confluence invitee

- **Conceived a self-initiated 0-to-1 product** by framing emergency blood availability as a coordination problem across demand, inventory, donor response, and regional shortages - not simply a donor-search problem.
- **Scoped the MVP around the critical fulfillment journey** - request -> inventory -> shortfall -> approval -> donor mobilization -> resolution - while deliberately deferring full transfer orchestration, network graph capabilities, and external blood-bank integrations.
- **Made explicit product trade-offs around automation and trust**: AI supports intake extraction, forecasting, investigation, and recommendations, while consequential inventory and fulfillment actions remain human-approved.
- **Designed workflows across five stakeholder roles** and reframed donor mobilization from compatibility matching to maximizing likelihood of fulfillment using eligibility, proximity, urgency, scarcity, donor history, and predicted response; validated ranking at 50K-donor scale (~515 ms p95 in cloud testing).
- **Expanded the product from reactive fulfillment to proactive planning** through Blood Weather, using regional demand and supply forecasts to surface potential shortages before they become emergency requests.
- **Closed the user-feedback loop**: after 8 early users struggled to understand a login-first experience, redesigned the entry flow as a public regional dashboard; follow-up testing with 10 previously unexposed users showed clearer understanding of the product purpose.

ADDITIONAL PROJECT

Narratix | Agentic Transcript-to-Video Platform

- **Built an agentic transcript-to-video workflow** that converts educational transcripts into animated explanations by separating content reasoning, visual planning, scene generation, and rendering.
- **Designed a modular multi-stage pipeline** using LLM orchestration and structured JSON between stages, with Manim/FFmpeg producing a complete video artifact from the source transcript.

EDUCATION

Vellore Institute of Technology, Bhopal
2020 - 2024

B.Tech, Computer Science & Engineering | CGPA: 8.38/10
